

TEDI

Telehealth Early Developmental
evaluation for Infants

Families face significant
barriers to access to high-
quality evaluations and
services for autism

Our goal is to increase
access to early
evaluations of autism

By connecting
families with experts

Using telecommunication
technologies

To provide families
access to evaluations
from their own homes

Preliminary findings
show TEDI can
capture key infant
behaviors with
reliable scores across
multiple sessions.

Families rated TEDI
highly in terms of
technology,
assessment
components, and
convenience.

Now we are looking
at those same key
features in more
infants, recruited
nationwide.

We will also compare
TEDI to existing
standardized
evaluation measures
in infants ages 6 to
18 months from the
LAAMB study.
